Presidio Park Global Forest Link Story

From our photos, we can infer that the forest is in average condition. There are no rivers through the section of the forest we were in, so this could not be used to determine whether there was a drought or not, but the trees and other flora were healthy. In addition, the trees and brush appeared to have decent water and did not look too dry. There were no large animals present where we were, but there were lots of smaller animals, such as squirrels, scurrying around the trees and bushes, which would imply good forest health. We saw a few artificial tree trunks, but there is no logging here, so these trees were likely dead or damaged, or it may have been likely that they would fall over, so they were cut down for the safety of the wildlife around them if they were infected or broken. Global Forest Watch has no forest gain or loss marked on our forest, and nor do any other internet sources. From Global Forest Watch, and our experience in the forest, we can conclude that the Presidio Park Forest is in good condition currently, judging from the flora and fauna, and our photographs.

The average temperature in San Diego the past year was a high of 70 degrees fahrenheit and a low of 58 degrees fahrenheit¹. There was 8.18 inches of rainfall last year² in as well which is a major reason San Diego and Presidio Park remain in a drought.
